

RBMR

Recover systems direct from Rubrik backups

With Cristie RBMR you can protect critical servers from the consequences of failure or disaster by recovering them directly from your Rubrik backups. Recover your protected servers, including operating systems, applications, user configuration and data, to any point in time provided by Rubrik. RBMR is managed through the Cristie Virtual Appliance (VA)

Flexible recovery targets

With our unique dissimilar environment technology you can recover to any physical, virtual or cloud target.

Identical Systems

Recover entire workloads including OS, applications, data and configuration information. With automation you can recover multiple systems from a single interface.

Recommended solution

RBMR is a recommended recovery solution for Rubrik and provided through approved channel partners.

How it works

RBMR allows you to perform a complete bare machine recovery of your system direct from a Rubrik backup. It also provides recovery assurance as the software can be scheduled to run through a complete recovery process. This fully automates the creation of the recovered machine and then runs test scripts to verify integrity and functionality. Schedules can be set up months in advance and planned so that the entire server infrastructure is tested over the course of the desired time frame. The recovery machines are held in an isolated network and can be released after every simulation so that storage is not permanently required. Detailed reporting highlights any problems encountered and provides an audit trail of successful results.

Intuitive interface and workflow

Perform a recovery by following this simple process:

1. Install RBMR on the client system to be protected.
2. License the software using a trial or full license. The software will then gather configuration parameters, including details about disk sizing, operating system, storage controllers, network adapters and network settings. Some of these details can be tailored.
3. Perform a standard Rubrik backup.
4. Boot the recovery environment on the target system and monitor the automated restore process.
